SUMMARY:

Full Stack Developer with experience in end-to-end development using Java Spring Boot and Vue.js. Skilled in hardware integration (RFID) and QA automation. Committed to writing clean code, rigorous testing, and fostering effective team collaboration.

SKILLS:

- Programming Languages: Java, JavaScript, Vanilla PHP
- Frameworks & Technologies: Spring Boot, Vue.js, Tailwind, Vite, Pinia, JWT Authentication
- Database: MySQL, PostgreSQL
- Tools & Version Control: Postman, Fork GUI, Git, Docker Desktop
- Testing & QA: Manual Testing, Selenium, Appium, Junit, Mockito, MockMvc, Allure
- Development Areas: Backend Development, API Development, REST API, Application Performance Optimization, SQL Query Optimization, End-to-End Testing

EDUCATION:

2018 - 2022
Indonesia Computer University (UNIKOM)
Associate Degree in Management Information | 3.60/4.00

PROFESSIONAL EXPERIENCE:

Role/Position : Backend Developer - RFID Integration
Company : PT WhiteOpen Teknologi
Duration : February 2025 – October 2025
Job Description :

- Managed the end-to-end integration pipeline connecting physical RFID readers to PostgreSQL databases via Java Spring Boot REST APIs for internal asset tracking.
- Refactored, modernized, and migrated legacy Java (JNE vendor) codebase into a clean Spring Boot architecture, handling database migration and schema refactoring between MySQL and PostgreSQL.
- Executed concurrency load testing and stress simulations to evaluate hardware-to-backend data throughput, eliminating data loss and ensuring real-time database synchronization.

Tech Tools/Technologies : Spring Boot, PostgreSQL, Server-Sent Events (SSE)

Role/Position : QA
Company : PT WhiteOpen Teknologi
Duration : July 2024 – January 2025
Job Description :

- Automated UI Testing: Engineered and executed automated UI test scripts using Selenium across multiple enterprise modules (Ticketing, Orca, ESS, and ARMS) strictly adhering to IFT and BCT documentation standards.
- Backend Unit & Logic Testing: Performed comprehensive backend unit testing using JUnit across Orca, Career, and ARMS modules to validate complex business logic, query integrity, and service-layer stability.
- Regression & Defect Prevention: Collaborated with cross-functional development teams to identify edge-case bugs, streamline test execution cycles, and prevent post-release regressions across active enterprise sprints.

Tech Tools/Technologies : Spring Boot, Junit, Mockito, MockMVC, Selenium, Appium, Allure

Role/Position : Full Stack Developer - ARMS (SMBCI)
Company : PT WhiteOpen Teknologi
Duration : April 2024 – December 2024
Job Description :

- Developed and enhanced core backend services and REST APIs using Java Spring Boot to support complex department filtering hierarchies and multi-tier approval workflows.
- Implemented backend unit tests (JUnit, Mockito, MockMvc) and exception handling frameworks across multiple enterprise modules including container approval and user administration.
- Resolved frontend-backend state bugs (such as dynamic form field resets and hierarchical dropdown dependencies in Angular) to ensure high data integrity.

Tech Tools/Technologies : Spring Boot, Angular.js, MySQL, Junit, Mockito, MockMVC

Role/Position : Full Stack Developer - Jaga Online (BTPNS)
Company : PT WhiteOpen Teknologi
Duration : January 2024 – March 2024
Job Description :

- Developed, maintained, and enhanced enterprise financial monitoring applications (Jaga Online BTPNS) using Java Spring Boot and PostgreSQL, ensuring secure and robust transaction workflows.
- Resolved complex multi-tier approval logic and workflow bugs (such as investigation checker routing, role-based visibility, and PIC delegation states) to streamline audit and compliance processes.
- Implemented backend calculation logic and performance optimizations, including SLA calculation modules for investigation timelines and automated request state transitions.
- Collaborated on REST API integration between frontend interfaces and backend services, ensuring seamless data synchronization across user roles (QA, Manager, BC, DH).

Tech Tools/Technologies : Spring Boot, Vue.js, PostgreSQL

Role/Position : Java Programmer Trainee
Company : PT Trilink Sistem Integrasi
Duration : August 2023 – December 2023
Job Description :

- Completed an intensive Java developer bootcamp covering Core Java, Object-Oriented Programming (OOP), JDBC, JPA, and PostgreSQL database management.
- Designed and developed hands-on case study applications using Spring Framework (backend) and Vue.js (frontend) to implement RESTful architectures and CRUD workflows.
- Solved algorithmic challenges and technical assessment problems under instructor supervision, maintaining clean code standards and proper error handling.
- Built and delivered a scaled end-to-end web application as the final program deliverable, demonstrating full-stack integration between Spring APIs and Vue components.

Tech Tools/Technologies : Core Java, Spring Boot, Vue.js, PostgreSQL

Role/Position : Backend Developer - Coral Reef Researcher
Company : Universitas Komputer Indonesia
Duration : September 2020 – February 2022
Job Description :

- Served as Backend Developer for the West Java Coral Reef (TKJB) research initiative, translating field survey data into structured database schemas and software requirements.
- Built modular backend systems and custom REST APIs from scratch using Native PHP (no framework) to handle data processing, user authentication, and CRUD operations.
- Designed responsive UI components using custom Bootstrap CSS and integrated them with Native PHP backend modules.
- Maintained core application modules, executed routine code refactoring, and performed systematic bug fixing to ensure long-term system stability.

Tech Tools/Technologies : PHP, JavaScript, MySQL, Css, Bootstrap, Leaflet.js

PROJECT:

RGC – Rise Global Chat (Personal Project)
2026

- Architected and shipped a complete real-time chat system spanning a C++20 game client (DLL plugin via REFramework) and a Python cloud backend, serving up to 200 concurrent users
- Built the C++ client with ImGui overlay, WebSocket/TLS networking (IXWebSocket), and Windows API hooking (GetRawInputData/GetRawInputBuffer) to solve input bleed — a known game modding challenge where keyboard input continues during chat typing.
- Implemented resilient networking: application-level handshake, exponential backoff with jitter for reconnection (1s–60s cap), and cross-platform timestamp conversion (Unix epoch → client local timezone).
- Built the Python backend (asyncio/websockets) with a channel system (up to 2 custom channels per player, 10 members each), per-client rate limiting, and diagnosed + fixed an event-loop hang caused by slow clients blocking async sends.
- Deployed to production on a dedicated VPS (Ubuntu, Nginx reverse proxy, Let's Encrypt SSL with auto-renew, systemd, UFW, Fail2ban), migrating from free-tier cloud hosting for higher capacity and reliability.
- Implemented a 10-layer security stack: auth token with XOR obfuscation and rotation support, per-IP connection limits (3 concurrent), per-IP failed-auth rate limiting, input sanitization, and message size limits.
- Published as open-source on GitHub and Nexus Mods under GPLv3, with full documentation, changelog, third-party attributions, and 4-version release history (v0.6.1 → v0.6.4).

ADS – AI Debugging System (Personal Project)
2026

- Engineered an end-to-end AI debugging platform consisting of a Spring Boot backend, Vue 3 dashboard, and a custom IntelliJ IDEA plugin (Java/Gradle) for automated error capture and analysis.
- Built Spring Boot REST APIs featuring JWT authentication, multi-tenant company management, real-time WebSocket broadcasting, and Supabase PostgreSQL integration, containerized via Docker and deployed on Render.
- Developed Vue 3 + Pinia + Tailwind frontend featuring real-time error monitoring dashboards, multi-provider AI configurations (Groq, OpenAI, Gemini, Claude), and multi-language support (ID/EN/JP/CH), deployed on Vercel.
- Implemented ByteBuddy bytecode instrumentation on target Spring methods to capture HTTP and startup errors, optimizing event volume from 2,000+ noise events to 1–2 precise events per request and resolving OOM risks.
- Designed an EventBus multi-source architecture with source-based deduplication (500ms delay) and signature caching to eliminate duplicate error reporting across console and agent layers.
- Integrated IntelliJ PasswordSafe for secure token storage and built an AI Learning system with automated JSON retention cleanup and failure-prevention context injection.

RFID Integration Asset Tracking (PT WhiteOpen Teknologi)
2025

- Served as the Backend Integration PIC, architecting the end-to-end data pipeline connecting physical RFID readers to a PostgreSQL database via Java Spring Boot REST APIs.
- Solved physical hardware signal instability (metal interference & EPC bounce) by implementing backend strict data-filtering algorithms, signature deduplication, and automated retry mechanisms.
- Executed load testing and concurrency stress simulations, ensuring zero data loss, real-time database synchronization, and instant asset tracking under high-volume scanning workloads.
- Handled PostgreSQL database schema design and internal backend maintenance to ensure high data integrity across tracking operations.

ARMS BTPN (SMBCI) – Feature Enhancement & Optimization (PT WhiteOpen Teknologi)
2024 - 2025

- Developed and enhanced core backend services and REST APIs using Java Spring Boot to support complex department filtering hierarchies and multi-tier approval workflows.
- Implemented backend unit tests (JUnit, Mockito, MockMvc) and exception handling frameworks across multiple enterprise modules including container approval and user administration.
- Resolved frontend-backend state bugs (such as dynamic form field resets and hierarchical dropdown dependencies in Angular) to ensure high data integrity.

Jaga Online BTPNS – Feature Enhancement (PT WhiteOpen Teknologi)
2023

- Developed, maintained, and enhanced enterprise financial monitoring applications using Java Spring Boot and PostgreSQL, ensuring secure and robust transaction workflows.
- Resolved complex multi-tier approval logic and workflow bugs (such as investigation checker routing, role-based visibility, and PIC delegation states) to streamline audit and compliance processes.
- Implemented backend calculation logic and performance optimizations, including SLA calculation modules for investigation timelines and automated request state transitions.
- Collaborated on REST API integration between frontend interfaces and backend services, ensuring seamless data synchronization across user roles (QA, Manager, BC, DH).

TKJB - Terumbu Karang Jawa Barat
2020 - 2022

- Tourism & Booking Management: Developed comprehensive backend modules for location administrators to manage tourism packages—including custom donation percentage configurations (e.g., booking surcharges for conservation)—and handle visitor reservation verification workflows.
- Donation & Batch Grouping Architecture: Built core donation lifecycle features (from payment validation and custom label messages to seedling distribution tracking) and a Batch Management system that groups multiple coral donations by planting location for efficient tracking.
- Periodic Maintenance & Monitoring Workflow: Engineered maintenance scheduling and tracking features, incorporating Google Maps coordinate integration, status transitions (Pending to Completed), and condition/photo logging to provide donors with transparent growth history.
- Custom Backend & UI Development: Built modular backend systems and custom REST APIs from scratch using Native PHP paired with responsive Bootstrap UI components to support full CRUD operations for local site managers.
